

# Best Management Practices for Construction and Development Projects Blanding's Turtle *Emydoidea blandingii*

**Common name** • Blanding's Turtle  
**Scientific name** • *Emydoidea blandingii*  
**Federal status** • None  
**State status** • Endangered

## Purpose and Use

The information in this document is to be used to help avoid and minimize species impacts due to construction practices. It is not intended to be used as a guide to manage habitat for a given species. If that is the goal, please contact the Department of Conservation for habitat management information. Because every project and location differs, following the recommendations within this document does not ensure that impacts will not occur to the species and additional information might be required in certain instances. Following the recommendations within this document does not complete Endangered Species Act consultation that may be necessary for species listed under the federal Endangered Species Act; please contact the U.S. Fish and Wildlife Service for more information.

## Ecology

Blanding's Turtles occur in many states in the Midwest and into southern Ontario. There also are isolated populations in Massachusetts and New Hampshire. In Missouri, they inhabit wetland areas in the northeastern and northwestern corner of the state. Blanding's Turtles, which are semi-aquatic in nature, spend time in marshes, water holes, sloughs, streams and ponds with relatively dense vegetation, but they also may be found in grasslands. They are active from late March to late October and overwinter in mud at the bottom of marshes or ponds. This species is known to travel considerable distance (up to 2 miles) between wetlands and to locate egg nesting sites. Courtship and mating mainly take place in April and early June. Females lay 6-15 eggs, typically in June, in sandy, well-drained soil that is well exposed to sunlight. Young typically hatch in September. Blanding's Turtles eat crayfish, aquatic larvae of insects, some terrestrial insects and frogs.

## Reasons for Decline

It is likely that Blanding's Turtles were never more widespread in Missouri than they are currently. However, destruction and alteration of wetlands and swamps for agriculture and urbanization projects has eliminated habitat for these turtles and limited their range here. Degradation of remaining habitat because of non-point

source pollution continues to threaten the status of the Blanding's Turtle in Missouri and nest predation is

extensive. This species is also sensitive to habitat alteration such as cultivation to the water's edge and use of herbicides.

## Specific Recommendations

Protection and restoration of wetlands is critical for the survival of many species, including the Blanding's Turtle. Due to the year-round requirement these animals have on wetlands, impacts on these areas within the range of this species should be minimized.

- Avoid removing or destroying unique habitat features, such as downed trees, that provide habitat for the Blanding's Turtle.
- Erosion and sediment controls should be implemented, maintained and monitored for the duration of the project.
- Disposal of wastes and garbage should be done in designated areas far from wetlands.
- Avoid altering water levels in wetlands where Blanding's Turtles are present.
- Turtle tunnels under roadways may help this species carry out reproductive activities or fencing barriers may be necessary to discourage use of roadways.
- Maintain both temporary and permanent wetlands and provide basking sites.
- At sites occupied by the turtle, activities (i.e., mowing, disking, burning, etc.) should be conducted during the inactive season between early November and late March.
- If application of pesticides, herbicides, and fertilizers in or near seasonal wetlands is necessary, carefully follow all label directions and consider application of more wildlife and wetland friendly herbicides and pesticides.
- Use of net-like mesh fabrics (plastics, nylon, twine, etc.) for erosion control should be avoided due to entrapment and entanglement hazards.

## General Recommendations

Refer to Management Recommendations for Construction Projects Affecting Missouri Wetlands and Management Recommendations for Construction Projects Affecting Missouri Streams and Rivers. Refer also to Amphibian and Reptile Management Guidelines.

If your project involves the use of Federal Highway Administration transportation funds, these recommendations may not fulfill all contract requirements. Please contact the Missouri Department of Transportation at 573-526-4778 or [www.modot.mo.gov/ehp/index.htm](http://www.modot.mo.gov/ehp/index.htm) for additional information on recommendations.

Water Act and the Endangered Species Act, and state or local laws need to be considered for construction and development projects, and require permits and/or consultation with the appropriate agency. Following the recommendations provided in this document will help reduce and avoid project impacts to the species, but impacts may still occur. Please contact the appropriate agency for further coordination and to complete compliance requirements.

## **Information Contacts**

For further information regarding regulations for development in wetlands, rivers and streams, contact:

For species information:

### [Missouri Department of Conservation](#)

Resource Science Division  
P.O. Box 180  
2901 W. Truman Blvd  
Jefferson City, MO 65102-0180  
Telephone: 573/751-4115

For species information and Endangered Species Act Coordination:

### [U.S. Fish and Wildlife Service](#)

Ecological Services  
101 Park Deville Drive, Suite A  
Columbia, MO 65203-0007  
Telephone: 573/234-2132

For Clean Water Act Coordination:

### [Missouri Department of Natural Resources](#)

Water Protection Program  
P.O. Box 176  
Jefferson City, MO 65102-0176  
Telephone: 573/751-1300, 800/361-4827

### [U.S. Army Corps of Engineers](#)
